UNDERGRADUATE OF COMPUTER ENGINEERING

Shishir Bastola

As a Computer Engineering undergrad, I've delved deep into programming, especially Python and C++. Through coursework, I've tackled computer architecture, algorithms, and data structures. Hands-on projects, like content-based filtering using scikit-learn, have sharpened my problem-solving and teamwork skills. I'm wrapping up my final project on secondary structure prediction.

EXPERIENCE

Data Science Intern

Facet Technology / Dhumbarahi / January, 2024 - February, 2024

During my 3-month internship, I worked with ontology and RDF to manage data, learned generative AI techniques, and gained hands-on experience with Large Language Models (LLMs). I used vector databases to handle large datasets, implemented Retrieval-Augmented Generation (RAG) methods, and developed applications using LangChain for streamlined AI processes.

TRAINING/CERTIFICATIONS

NLP In Python

codebasics / 2024

I acquired Natural Language Processing (NLP) skills through a basic course on YouTube from Codebasics, where I constructed a chatbot that understands conversation flow.

AWS

Advanced Collage of Engineering / 2023

I received training on AWS during our university's Enterprise Computing course, where we covered fundamental AWS concepts such as S3 buckets and EC2 instances.

EDUCATION

Bachelor in Computer Engineering

Advanced Collage of Engineering and Managemnet / Kathmandu / August, 2019 - Present

Computer Engineering Fundamentals, Computational Algorithms, Software and Hardware Engineering.

PROJECTS

Protein Secondary Structure Prediction

SKILLS

- Django framework - Experienced
- rest - Beginner
- Langchain - Beginner
- NLP - Beginner
- LLM - Beginner
- VectorDb - Beginner
- ontology - Novice
- RDF - Novice
- figma - Skillful
- Programming Python, C, C++ - Skillful
- cluster and classification - Novice
- Data Visualization - Novice
- Nginx, Azure, AWS S3 - Beginner

LANGUAGE

Nepali ●●●●○

English ●●●○○

It is a Computer Engineering major project, we conducted a research-based project focused on utilizing various neural network architectures for secondary protein structure prediction.

- **Key Features:** Bi-TCN, Bi-RNN, RNN, and TCN neural network architectures for protein structure prediction.
- **My Role and Responsibilities:** RNN implementation and research for protein structure prediction, also contributed to project documentation.
- **Skills Utilized:** Machine learning techniques, data preprocessing, hyperparameter tuning, and feature engineering, with strong analytical skills and research.
- **Achievements:** Implemented and evaluated multiple neural network architectures for protein structure prediction, identifying Bi-TCN as the most effective, and offering valuable insights for future research.

Vadagadi

"Vadagadi" is a vehicle recommendation platform developed using Django. Here are the key features of this project:

- **Recommendation Systems:** It has content-based and collaborative filtering algorithms to provide personalized vehicle recommendations based on user preferences.
- **User Authentication System:** It contains a user authentication system using Django to secure and personalize user experiences.
- **Order History:** Developed an order history feature, allowing users to track their previous vehicle selections for an enhanced browsing experience.
- **Filtering Options:** It contains filtering options, enabling users to search results based on categories, such as cars and bikes, as well as other criteria.
- **Price Filtering:** It provides a dynamic price filtering system to assist users in finding vehicles within their specified budget.
- **Contact Us via Mail:** Included a "Contact Us" feature, allowing users to reach out via email for inquiries and feedback.
- **Technology Used:** Built on the Django framework, utilizing content-based and collaborative filtering techniques. The project also incorporates a user authentication system and features HTML, CSS, and other technologies to enhance the user interface.

Talk to PDF

In this project, I learned key concepts and tools related to generative AI. I worked with large language models (LLMs) and integrated them with vector databases for efficient data retrieval. I used Hugging Face models for various natural language processing tasks and applied CTransformers for optimizing model performance, and utilized LangChain for building AI workflows. Additionally, I gained hands-on experience with OpenAI's tools to build AI applications. This project enhanced my skills in AI model implementation and practical applications.

Blogging webpage

It is a blogging website using Python's Django framework. Project Contributions are:

- **User Authentication System:** It has a secure user authentication system with login, register, and forget password features using Django's authentication system.
- **Email Verification System:** Email verification using Django to enhance account security and validate user identities.
- **Email Notification System:** Email notification system utilizing Django's email capabilities to keep users informed about activities and updates.
- **Comment System:** Dynamic comment system within the Django framework to foster user engagement and facilitate discussions on blog posts.
- **Blogging History:** Blogging history feature using Django models, allowing users to track and revisit their past posts for an enhanced user experience.
- **Technology used:** It is built using HTML, CSS, Materialize for styling, and Auth0 for additional authentication functionalities, in addition to Django for the backend.

Movie Recomendation

I developed a movie recommendation system using cosine similarity. This means the system finds similarities between users' tastes and movie attributes to suggest films they might like. By comparing things like genre, actors, and plot, it offers personalized suggestions. It's like having a friend who knows exactly what movies you'll enjoy based on your preferences and what you've watched before.
